

The background of the slide features three wind turbines in silhouette against a sunset sky. The sky transitions from a deep purple at the top to a bright orange near the horizon, with some light clouds visible. The turbines are positioned at different heights and angles, creating a sense of depth.

24/7 carbon free energy

System-level impacts of hourly clean electricity markets, and lessons from the UK on their implementation

Agenda

- Introduction
- System-level impacts of 24/7 CFE: a literature review
- Lessons on practical implementation of hourly RE markets from the UK
- Conclusions

A wide-angle photograph of an offshore wind farm. The scene is dominated by a clear, light blue sky and a calm, blue sea. In the foreground, a large wind turbine stands prominently, its three blades extending upwards. Behind it, a series of other wind turbines are visible, receding into the distance. The overall atmosphere is serene and clean, representing renewable energy. The word "Introduction" is overlaid in the center in a white, sans-serif font.

Introduction

What is clean electricity?

Since all power stations use the same electricity grid...

Certificates

are used to track renewable energy

The **Greenhouse Gas Protocol** sets the rules on carbon accounting...

... and stipulates purchasing clean energy certificates to reduce scope 2 emissions¹

Clean Energy
Certificates

0 Scope 2
Emissions

This is known as...

Market-based Carbon Accounting

¹ Greenhouse Gas Protocol, "Scope 2 Guidance," World Resources Institute, Washington DC, 2015.

The current energy certificate system has a serious problem.

The current system records location but not time of production, and matches consumption and generation using these certificates over an **annual** period

Solar generation VS consumption over a day

Consumption at night can be matched with generation from solar at noon

This does not reflect the physical reality of the grid and can overestimate emissions savings by up to 50%¹

¹ Matthew Brander, Michael Gillenwater, Francisco Ascui, Creative accounting: A critical perspective on the market-based method for reporting purchased electricity (scope 2) emissions, Energy Policy, Volume 112, 2018, Pages 29-33

Moving to “hourly” certificates may solve this problem

Using certificates that enforces matching between generation and consumption on an hourly or sub-hourly time period could yield significant benefits

Rebuilding trust
with consumers

by solving the main
issue of timing
mismatch between
generation and
consumption

Additional revenues
for storage &
flexibility

by capturing the
spread between low
and high price hours

More accurate
carbon accounting

as electricity’s carbon
intensity actually
varies significantly on
an hourly basis

A photograph of an offshore wind farm at sea. The sky is a clear, light blue, and the water is a darker blue with gentle ripples. Several wind turbines are visible, with one in the foreground being the most prominent. The text is overlaid on the image.

System-level impacts of hourly RE markets

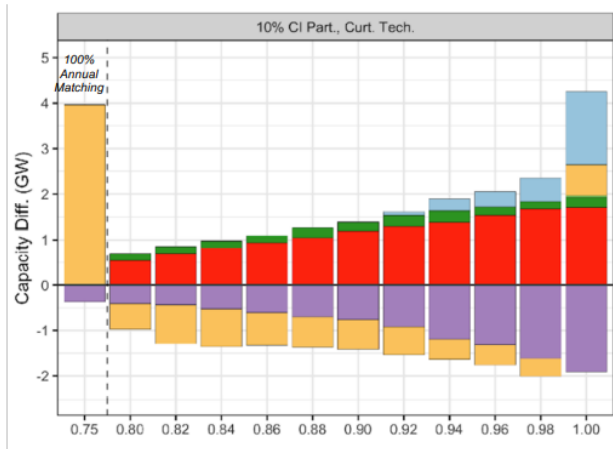

A literature review

Key papers

- “Advancing Decarbonisation Through Clean Electricity Procurement”, IEA, November 2022
- “System-level Impacts of 24/7 Carbon-free electricity procurement in Europe”, TU Berlin, October 2022
- “Electricity System and Market Impacts of Time-based Attribute Trading and 24/7 Carbon-free Electricity Procurement”, Princeton Zero Lab, September 2022
- “System-level Impacts of 24/7 Carbon-free Electricity Procurement”, Princeton Zero Lab, November 2021

Key Finding 1: Hourly RE procurement can deliver smarter investment in RE capacity

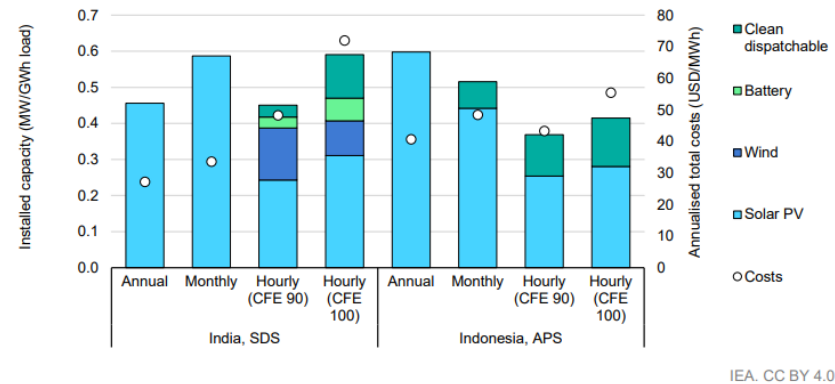

California:
additional 2 GW
geothermal capacity

Source: Princeton Zero Lab

India and Indonesia:
Diversification from solar to wind and
clean dispatchable resources

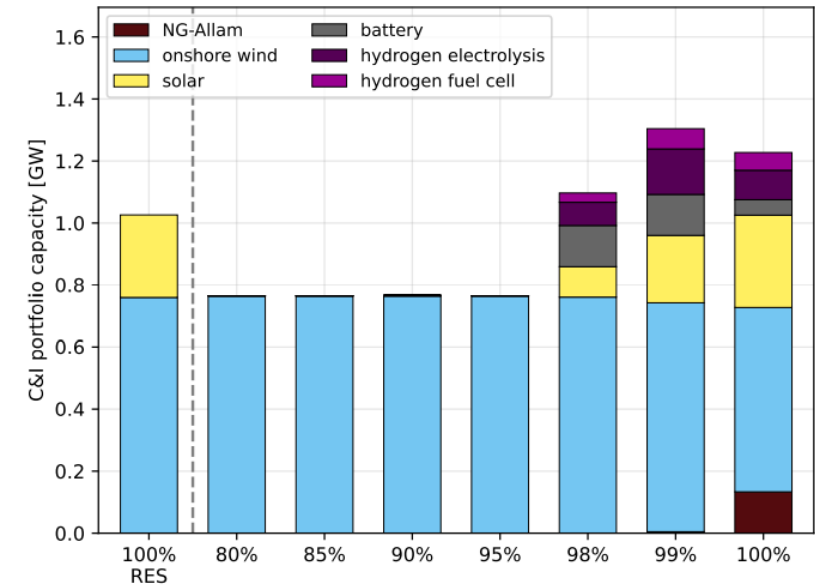

Procurement portfolios and procurement cost for annual and hourly demand matching in India and Indonesia, 2030

Notes: CFE = carbon-free energy, SDS = Sustainable Development Scenario, APS = Announced Pledges Scenario. The CFE 100 case is based on corporate portfolio built to fully meet corporate demand in every hour; the CFE 90 case uses a corporate portfolio that depends on imports in some hours but achieves a CFE score of 90 based on the [methodology published by Google](#).

Source: IEA

Denmark:
additional 0.35 GW wind and
clean dispatchable resources

Source: TU Berlin

Key Finding 2: Hourly RE markets can promote the integration of storage on the grid

Clean Energy Certificate Price Variation in California

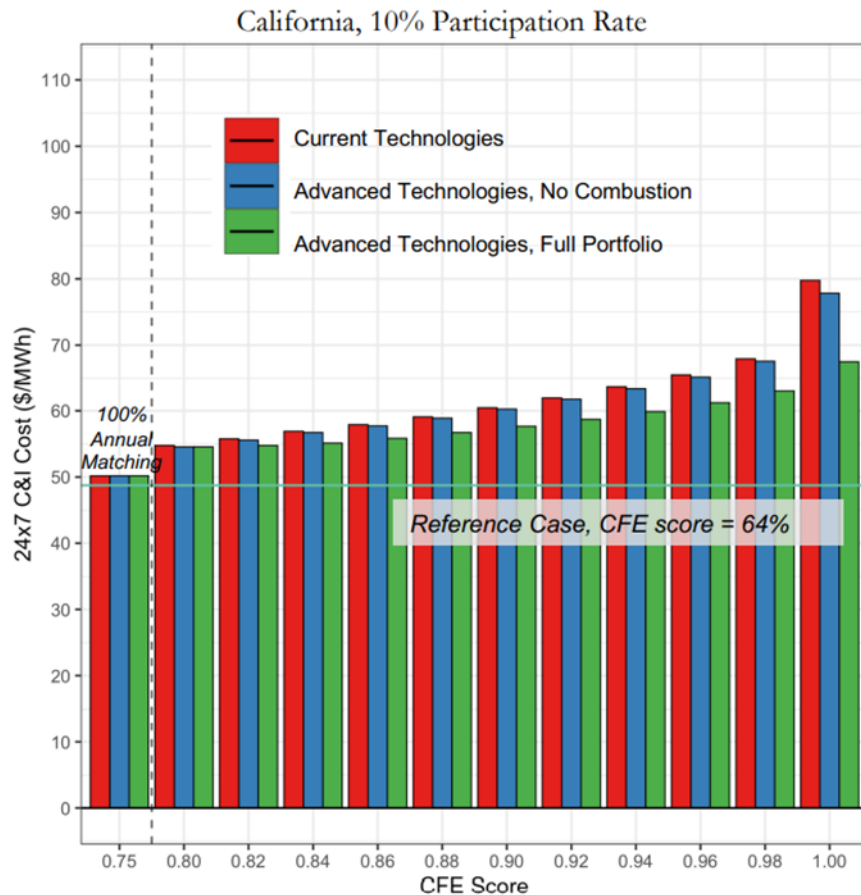

Source: Princeton Zero Lab

Modelling of California's energy system shows that hourly clean energy certificate (T-EAC) prices can vary by as much as \$106/MWh in a single day.

This allows storage assets to capture the spread in price, giving them an additional revenue stream.

Key Finding 3: 100% hourly RE is more expensive but delivers higher system value.

Cost for 24/7 participating C&I consumers – California

Source: Princeton Zero Lab

System costs and value contribution in India and Indonesia, 2030

IEA. CC BY 4.0.

Notes: CFE = carbon-free energy, SDS = Sustainable Development Scenario, APS = Announced Pledges Scenario. The CFE 100 case is based on corporate portfolio built to fully meet corporate demand in every hour; the CFE 90 case uses a corporate portfolio that depends on imports in some hours but achieves a CFE score of 90 based on the [methodology published by Google](#). Isolated dispatch refers to a case in which the corporate portfolio is operated only to match the corporate load profile. Optimised dispatch seeks to align optimisation of the corporate portfolio with that of the entire power system.

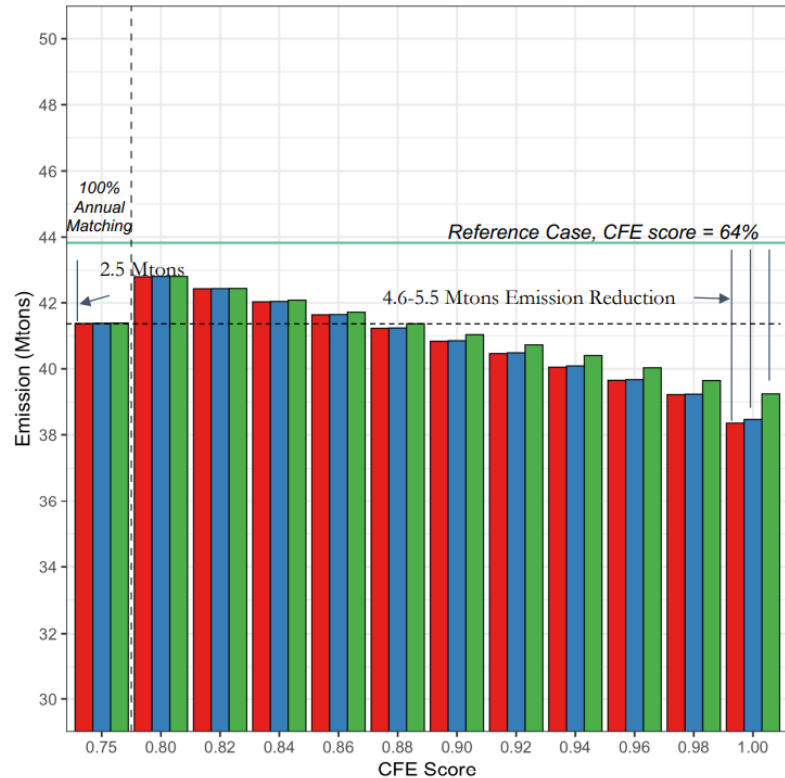

Source: IEA

Key finding 4: hourly RE markets deliver better grid decarbonisation outcomes

California:

2.5M tons CO₂ reduced vs annual RE markets per year (+ 84%-120%)

10% C&I Participation

Source: Princeton Zero Lab

Germany:

2M tons CO₂ reduced vs annual RE markets per year (+30%)

Source: TU Berlin

A photograph of an offshore wind farm at sea. The sky is a clear, light blue, and the water is a darker blue with gentle ripples. Several wind turbines are visible, with one in the foreground being larger and more prominent than the others. The turbines are silhouetted against the sky. The overall scene is calm and serene.

Practical Implementation of hourly RE markets

Lessons from the UK

The GB Demonstrator Project– The importance of involving many electricity market stakeholders.

GRANULAR

- Start up providing SaaS services to manage and trade certificates
- Role:
 - Pilot lead, overseeing the whole certification scheme
 - Provides certificate management platform to participant
 - Jointly develop the exchange with Nord Pool

NORD POOL

- Nord Pool, Europe's leading power market, delivers efficient, simple and secure trading across Europe
- Role:
 - Exchange platform and auction development
 - Operate the exchange
 - REGO account trustee

ELEXON

- Elexon manages the BSC, and the power imbalance mechanism.
- Role:
 - Support to design the certification framework
 - Expertise on GB metering and settlements
 - Exploring further roles in an enduring solution (e.g. metering, imbalance)

- European IT software company providing products and solutions in Energy and Utilities for TSOs, European initiatives, Exchanges, Energy Certificates, Power Trading, Flexibility, Electromobility and more.
- Role: provides the hourly certificate registry

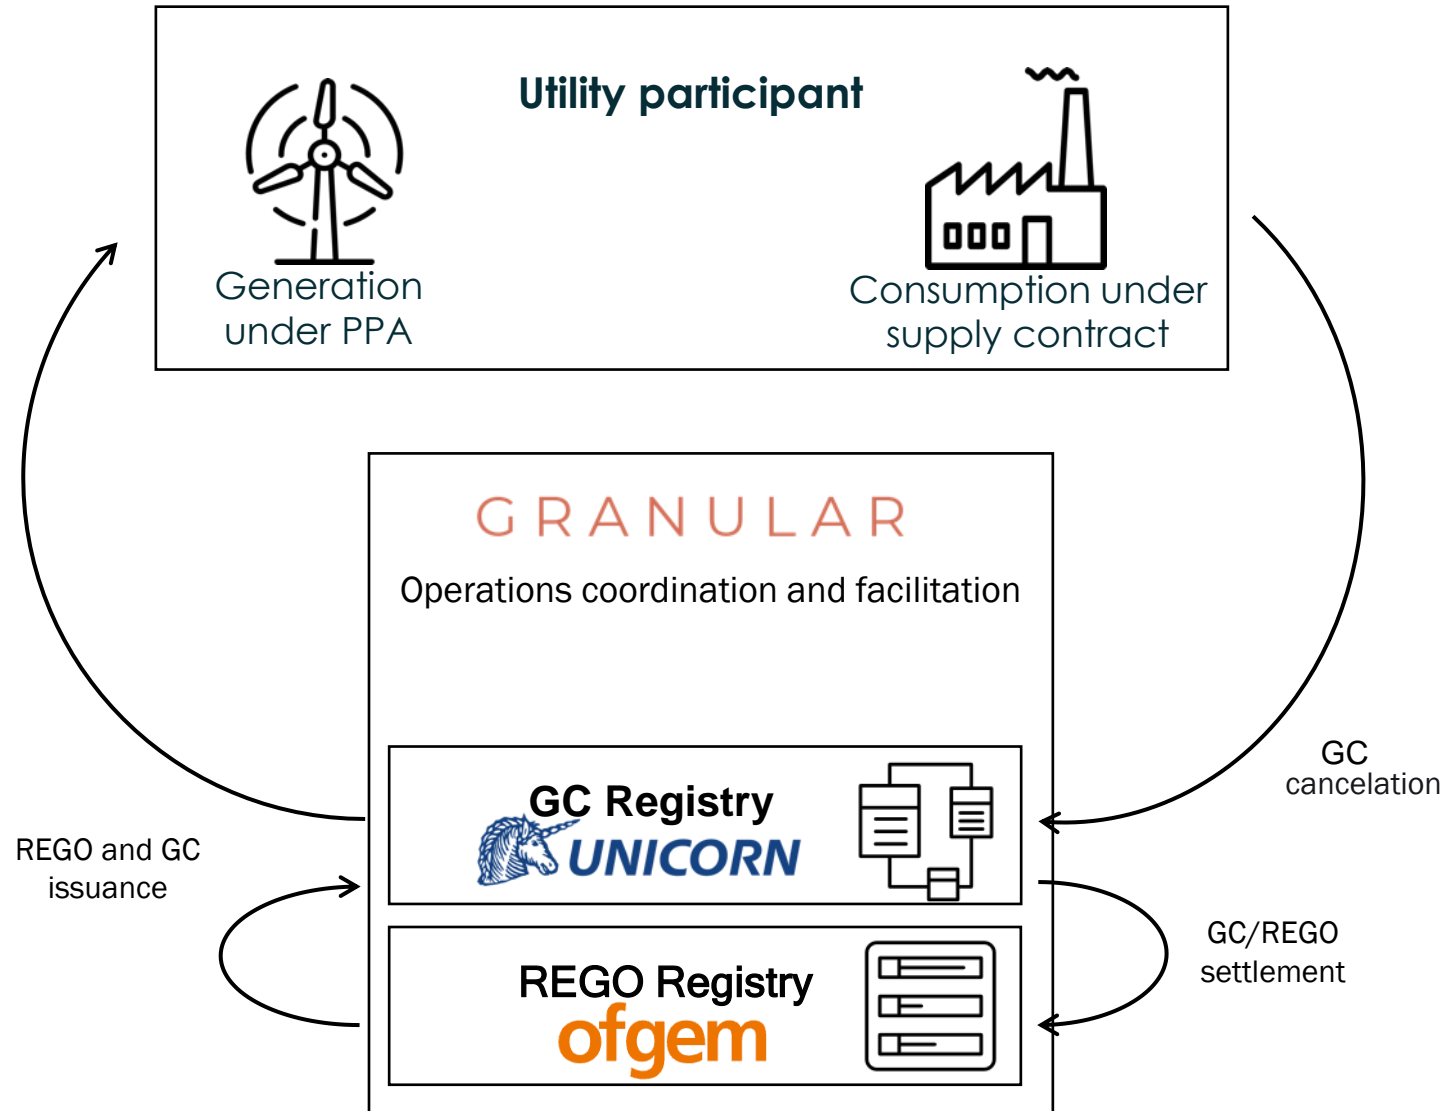

- independent, not-for-profit innovation centre
- Role:
 - Expertise to design the certification framework
 - Support drafting the pilot reports
 - Support disseminating findings of the PoC

Other supporters

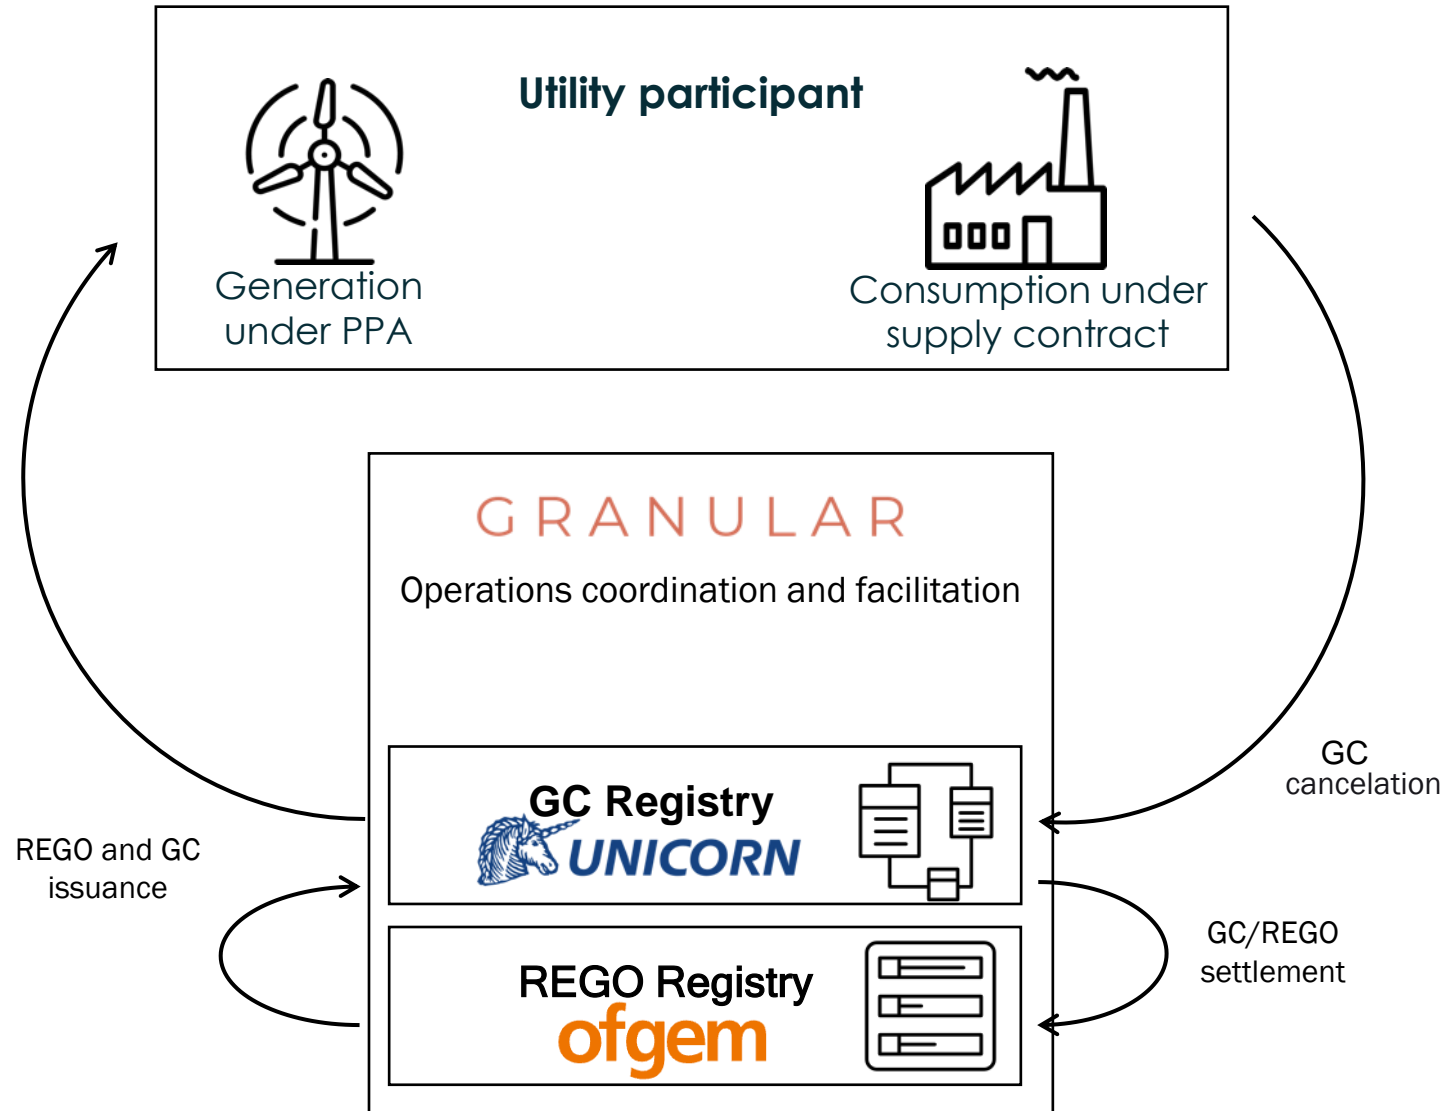

- **NGESO**: supportive of the initiative, will participate to stakeholder engagement process and reports
- **PWC (in discussions)**: audit of the certification scheme

The GB Demonstrator Project– Utilities emerge as key players

- Utilities sit at a key node in power markets
- They have access to both consumption and generation data
- They are already experienced in managing the matching of consumption and production in forward, day-ahead, and intra-day electricity markets
- **Utilities are the key to scaling hourly electricity markets**

The GB demonstrator Project – Importance of accommodating legacy certificate systems

- Legacy certificate systems are present in most advanced electricity markets
- Their core role is to prevent double counting of renewable energy claims
- Introducing a new certificate system could risk double counting
- Hourly electricity markets must initially be backward-compatible with legacy certificate systems to prevent double counting.

A photograph of an offshore wind farm at sunset. The sky is a gradient of blue and orange, and the water is dark blue with gentle ripples. Several wind turbines are visible, with the largest one in the foreground on the right. The word "Conclusions" is written in white, bold, sans-serif font across the center of the image.

Conclusions

Conclusions

- Hourly electricity markets are a new and rapidly evolving field
- Likely to play a key role in the energy transition

- More data and academic studies are needed, particularly on policy implications.
